

K-Dance Stage Hub: Integrated Dashboard for Dance Performances

Project Title: K-Dance Stage Hub

Core Definition: A Streamlit-based interactive data dashboard

Target Audience: Dance majors and students, cultural and arts researchers, and dance audiences

why this topic?

Stage 1: Planning & Data Gathering

- Analyzed live performance lineups from Interpark Ticket and major venues (Seoul Arts Center, LG Arts Center, etc.).**
- Secured a comprehensive dataset of 40 performances, ranging from national public companies to world-renowned international choreographers (Crystal Pite, Alexander Ekman, etc.).**
- Selected key arts management metrics: booking rates, ticket prices, and regions.**

Stage 2: Structuring & Multilingual Design

- Organized unstructured data systematically into a clean data.csv file.**
- Designed a multilingual toggle logic (Korean/English) to cater to global audiences.**
- Mapped performance schedules (start/end dates) and integrated actual booking hyperlinks.**

Stage 3: Interactive UX Implementation

- Implemented a 4-tier filtering system based on user preferences (Genre, Region, Month, and a Ticket Price Slider).**
- Created a customized 'Dance Genre Quick Guide' block reflecting a dance major's unique perspective.**

Stage 4: Deployment & Optimization

- Managed the source code and datasets professionally by separating code from the CSV file on GitHub.**
- Deployed the live web service utilizing Streamlit Cloud.**
- Conducted continuous debugging and error troubleshooting to ensure a stable user environment.**

what i learn

Python Coding and Streamlit

Confidence in IT skills

I have developed an expansive planning perspective that allows me to draw a roadmap for future development.

Thank You
